Correct variable names consist only of English letters, digits and underscores and they can't start with a digit.

Check if the given string is a correct variable name.

Example

- For `name = "var_1__Int"`, the output should be
  `variableName(name) = true;`
- For `name = "qq-q"`, the output should be
  `variableName(name) = false;`
- For `name = "2w2"`, the output should be
  `variableName(name) = false.`

Input/Output

- **[execution time limit] 0.5 seconds (cpp)**

- **[input] string name**

  Guaranteed constraints:
  `1 ≤ name.length ≤ 10.`

- **[output] boolean**
